Digital Diagnostic Memory Map

The transceivers provide serial ID memory contents and diagnostic information about current operating conditions via the 2-wire serial interface (SCL, SDA).

The diagnostic functions are implemented with internal calibration to monitor received optical power, transmitted optical power, bias current, supply voltage, and temperature.

The specific data fields of the digital diagnostic memory map are defined as follows.

Notes:

Plug Seq.: Pin engagement sequence during hot plugging.

1. TX Fault is an open-collector output that should be pulled up with a 4.7 k Ohm to 10 kOhm resistor on the host board to a voltage between 2.0 V and Vcc + 0.3 V. Logic 0 indicates normal operation; Logic 1 indicates a laser fault. In the low state, the output will be pulled to less than 0.8 V.
2. Laser output is disabled when TX Disable > 2.0 V or is open, and enabled when TX Disable < 0.8 V.
3. LOS is an open-collector output that should be pulled up with a 4.7 kOhm to 10 kOhm resistor on the host board to a voltage between 2.0 V and 3.6 V. Logic 0 indicates normal operation, while Logic 1 indicates loss of signal.
4. RD-/RD+: These are the differential receiver outputs. They are internally AC-coupled 100 Ohm differential lines that must be terminated with a 100 Ohm differential load at the host SERDES.
5. TD-/TD+: These are the differential transmitter inputs. They are internally AC-coupled 100 Ohm differential lines with internal differential termination inside the module.
